

20 Years of TRMM-GPM Precipitation Tracking of the MJO and Its Implication for Tropical Weather and Climate

Shuyi S. Chen, Brandon Kerns, and Ajda Savarin
University of Washington
Hui Su, JPL (Poster # 240)

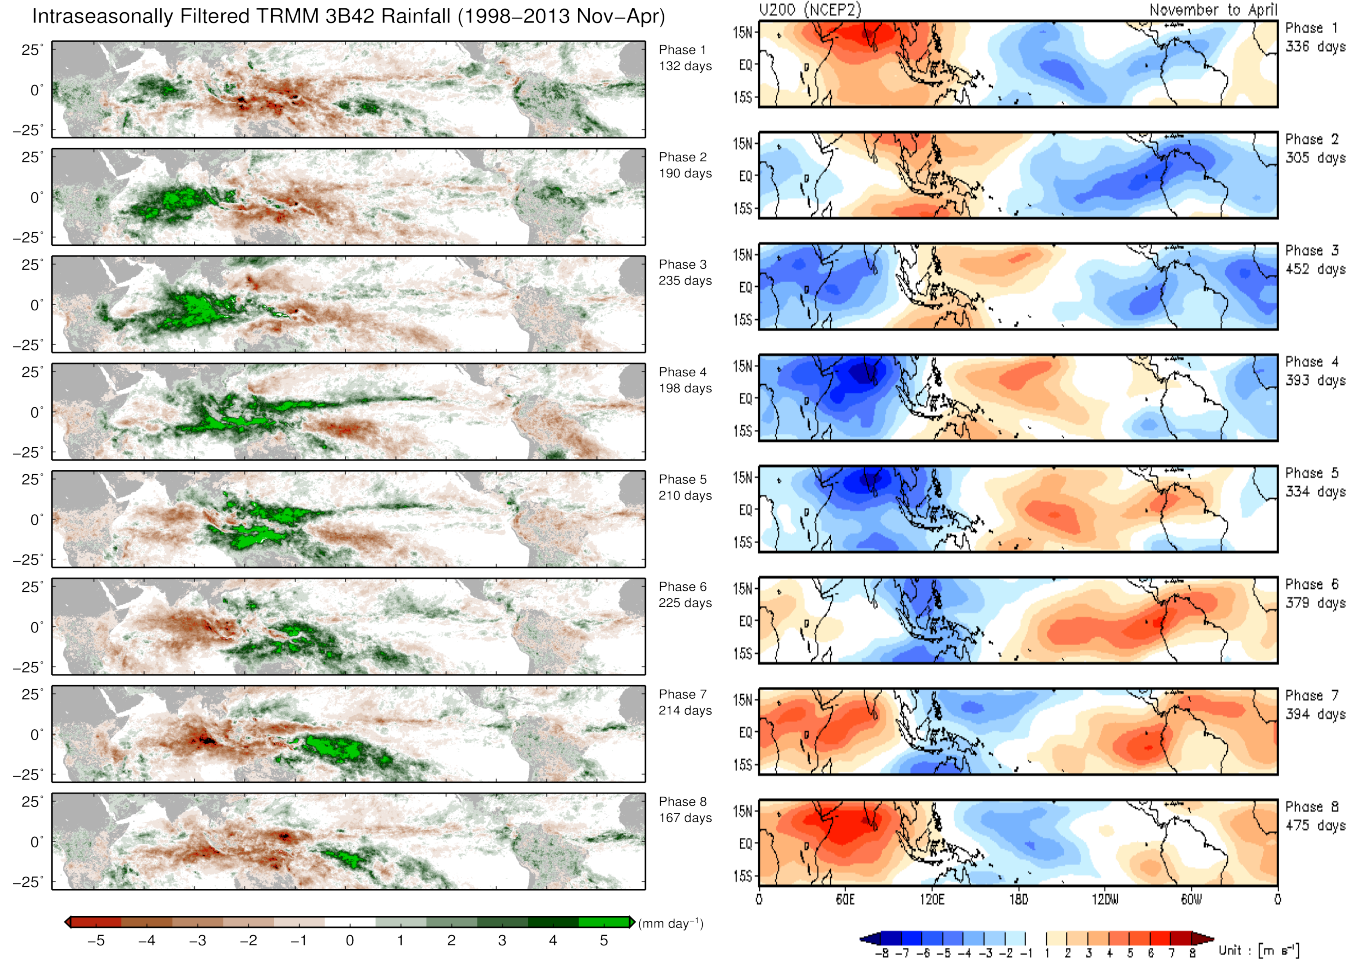

(PMM Science Team Meeting, Phoenix, AZ, 9-11 October 2018)

Hurricanes and Coupled Atmosphere-Ocean Systems

What is the MJO?

MJO Life cycle composite

Realtime Multivariate MJO (RMM) Index (Wheeler and Hendon, 2004)

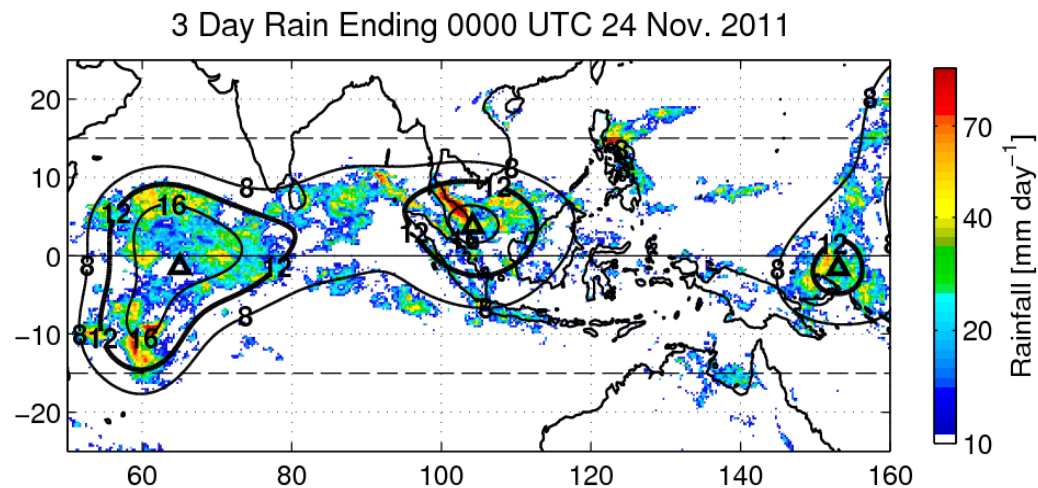

Limitations:

- No spatial & temporal info
- Not a direct representation of MJO precipitation
- Cannot be computed in regional models

Large-scale Precipitation Tracking (LPT):

- TMPA 3B42 V7 data (3 hourly)
- **LP Object (LPO)** : 3-day accumulated rainfall with spatial filter ($5^\circ \times 5^\circ$) area of $> 12 \text{ mm day}^{-1}$ ($> 250,000 \text{ km}^2$)
- **LP Tracking (LPT)**: track LPO in time > 7 days
- **MJO LPT**: LPT > 10 days; eastward propagation speed $> 0 \text{ m/s}$

Kerns and Chen (2016, JGR)

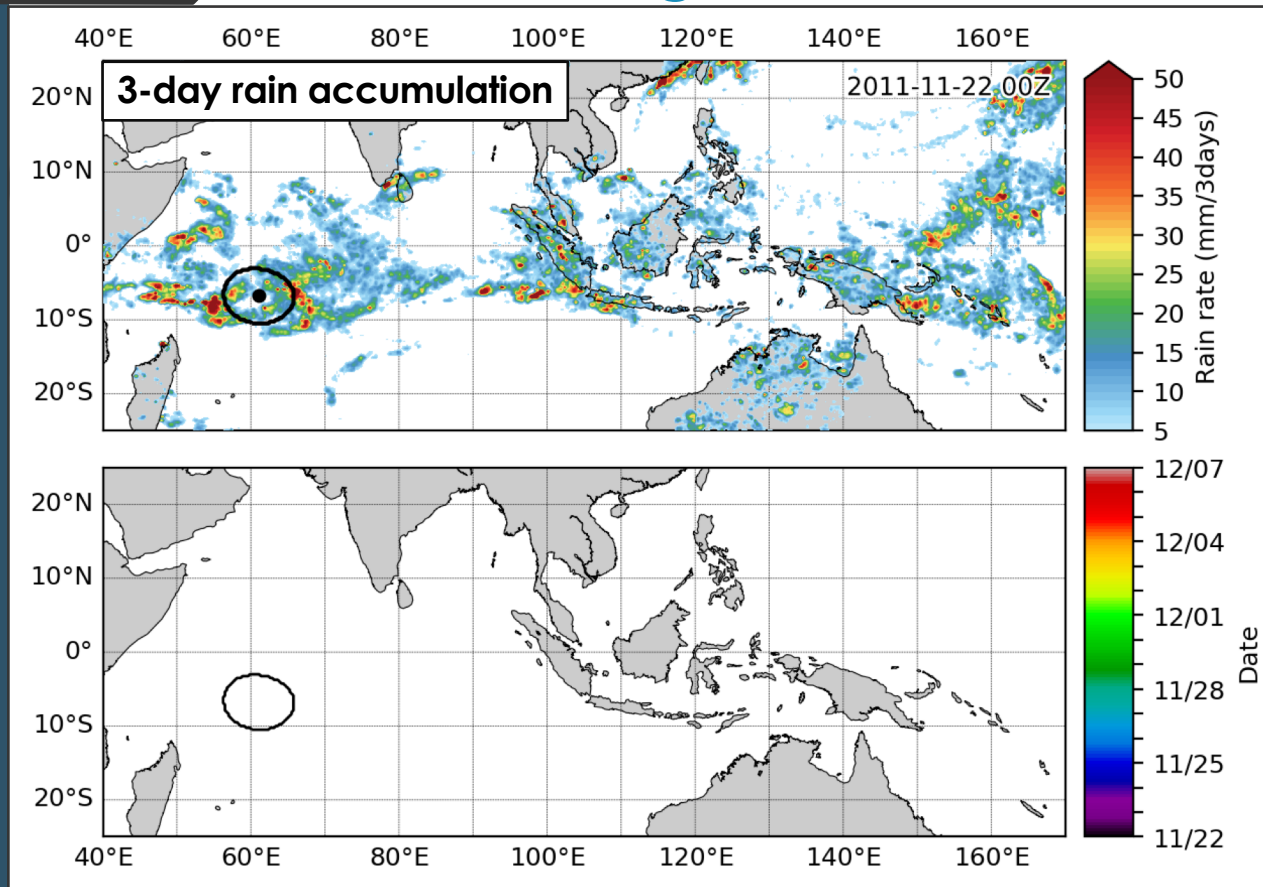

LPT

MJO LPT

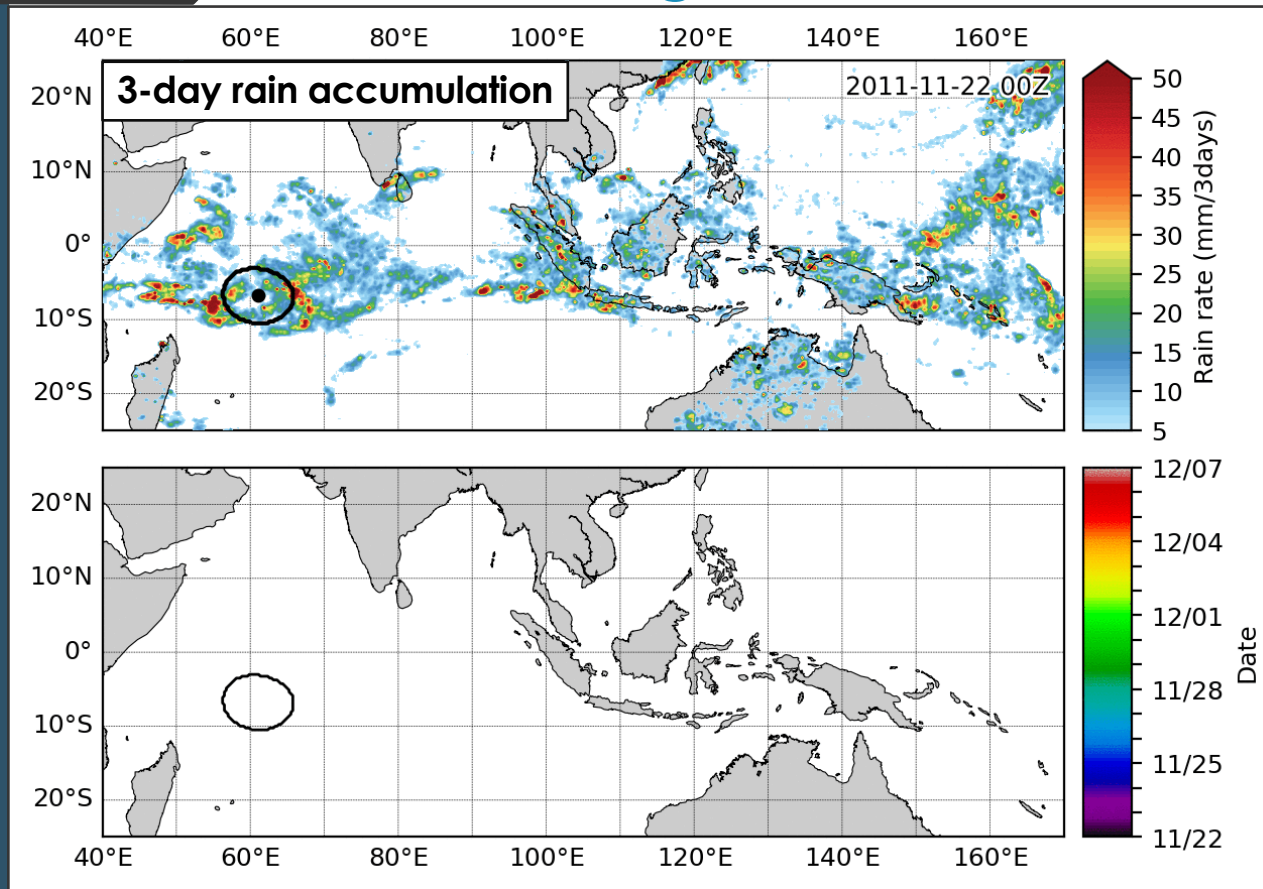

Tracking the MJO

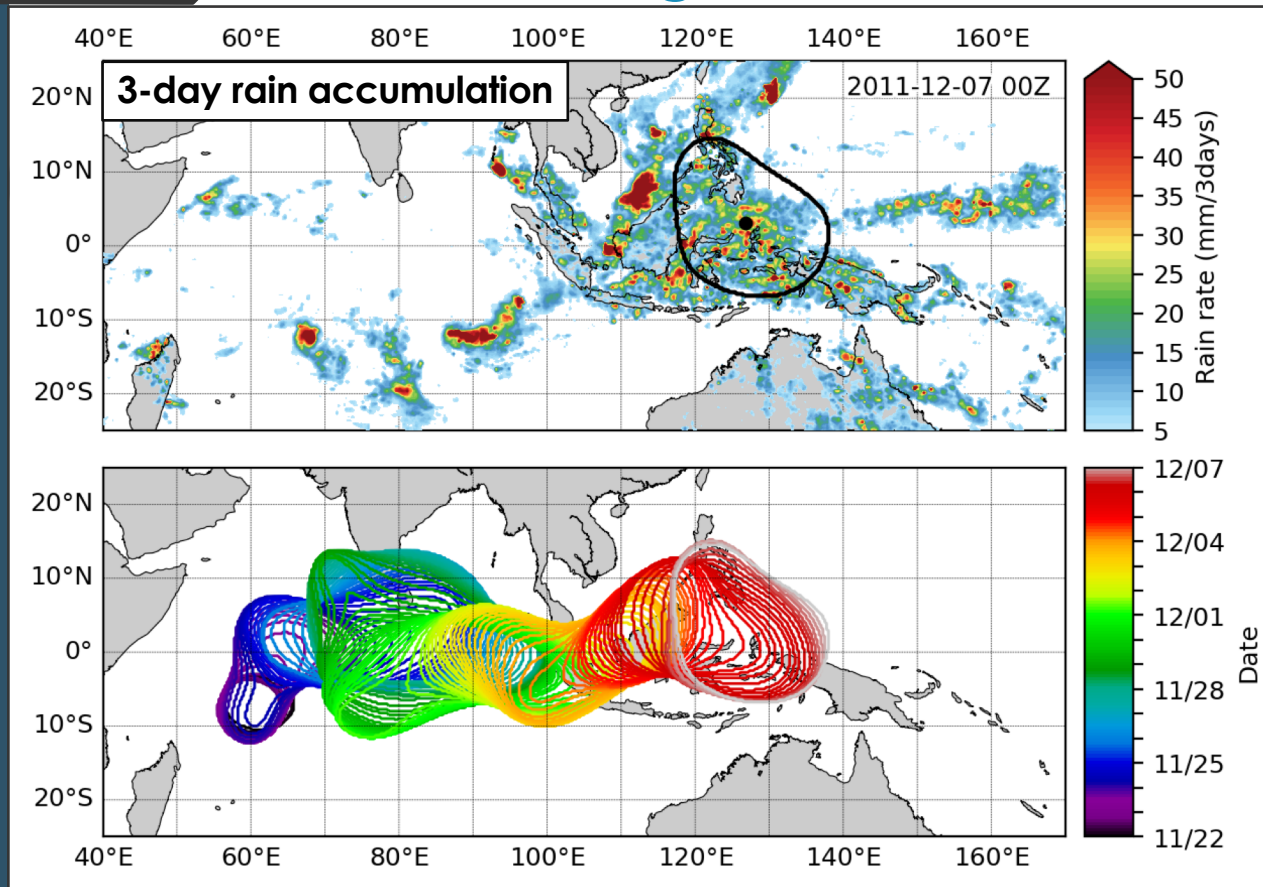

- Traditional RMM index cannot provide spatial and temporal variation of the MJO.
- LPT is used to track MJO precipitation. (Kerns and Chen 2016)

Tracking the MJO

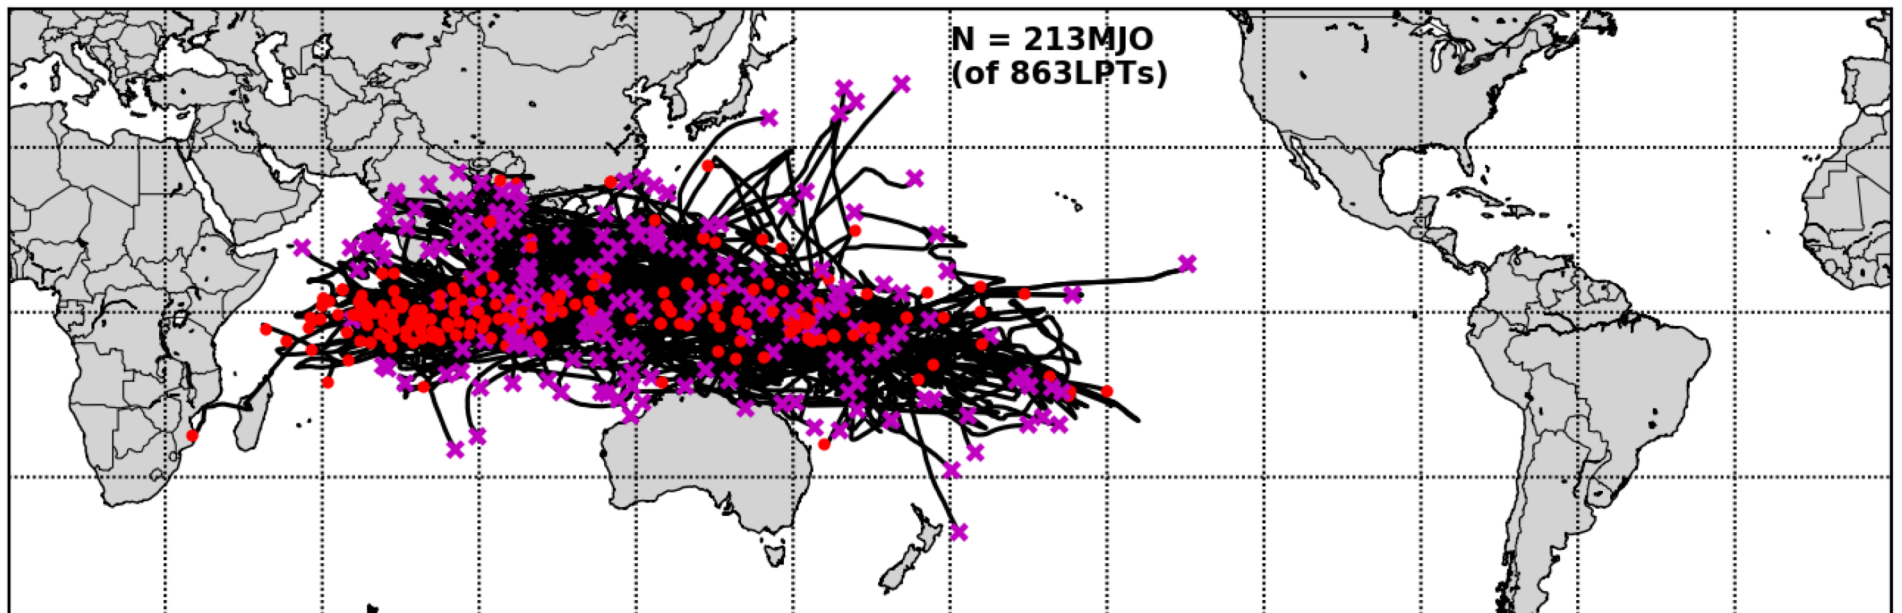

- Traditional RMM index cannot provide spatial and temporal variation of the MJO.
- LPT is used to track MJO precipitation. (Kerns and Chen 2016)

Tracking the MJO

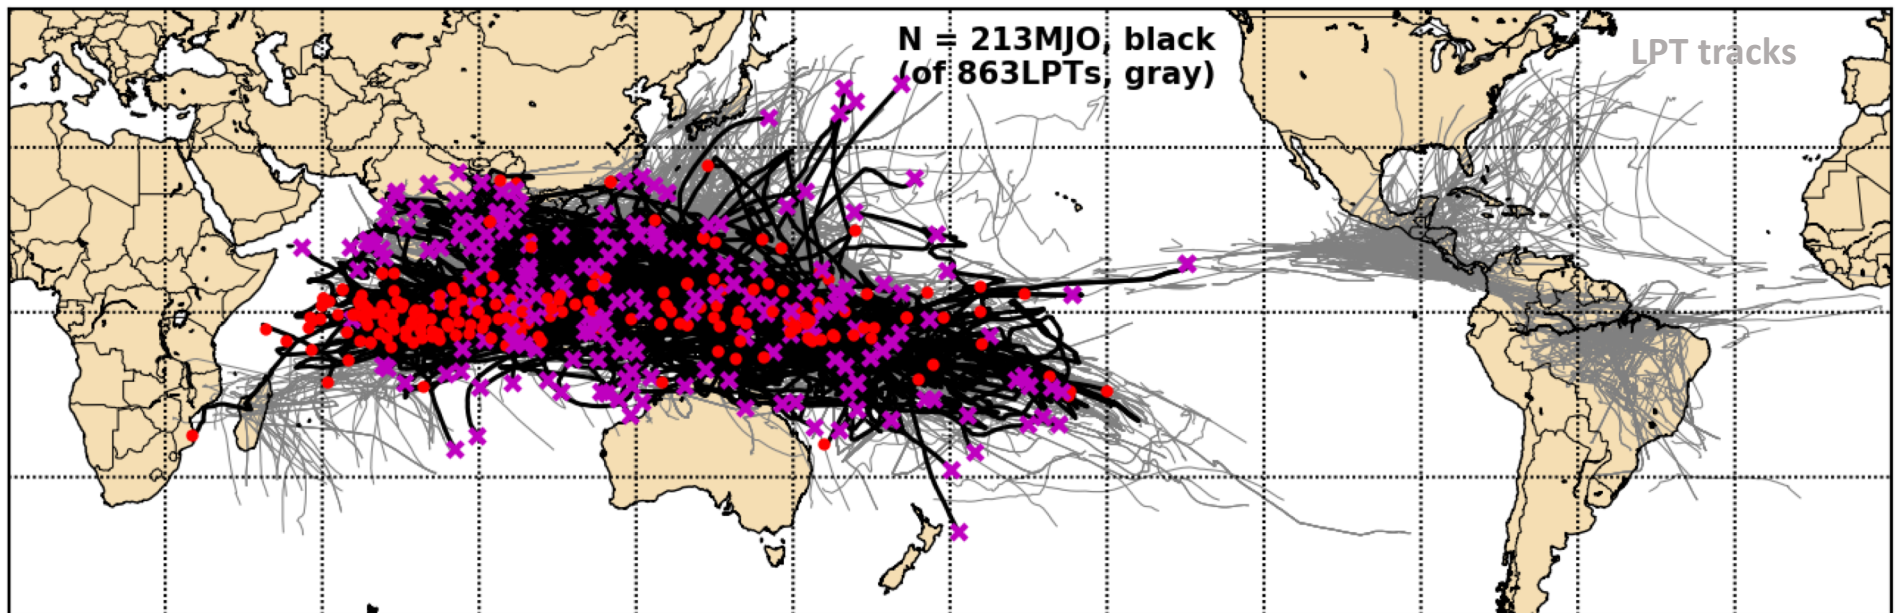

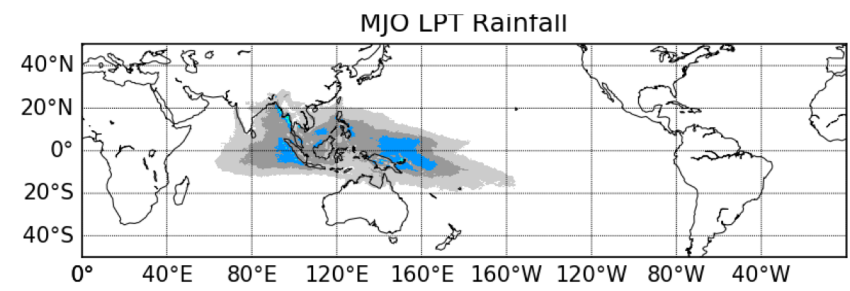

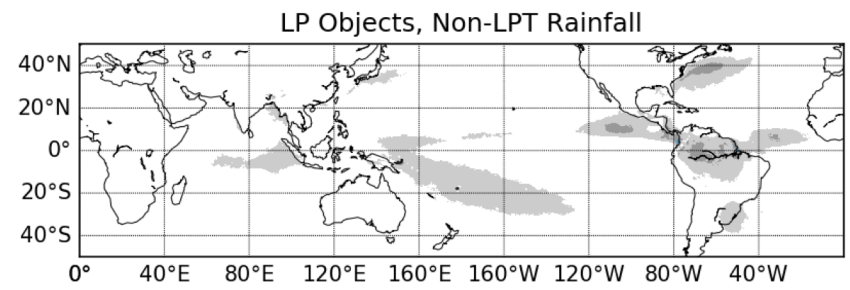

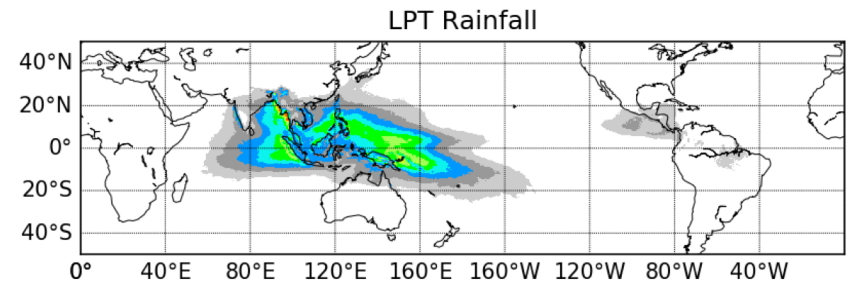

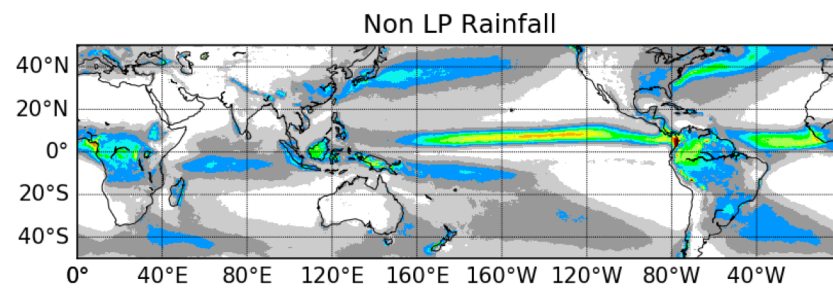

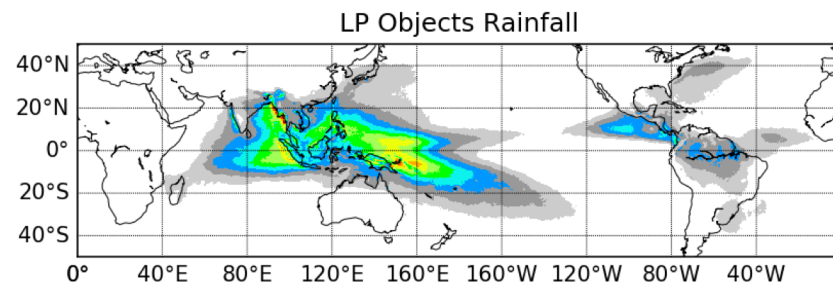

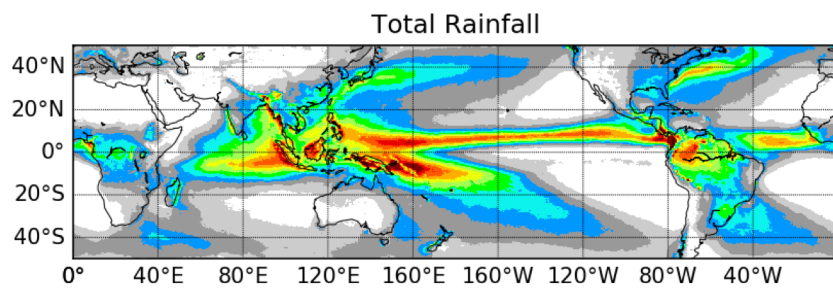

- Traditional RMM index cannot provide spatial and temporal variation of the MJO.
- LPT is used to track MJO precipitation. (**Kerns and Chen 2016**)
- Challenge: majority of NWP and climate models cannot reproduce MJO precipitation patterns.

MJO LPT System Tracks: 1998 - 2018

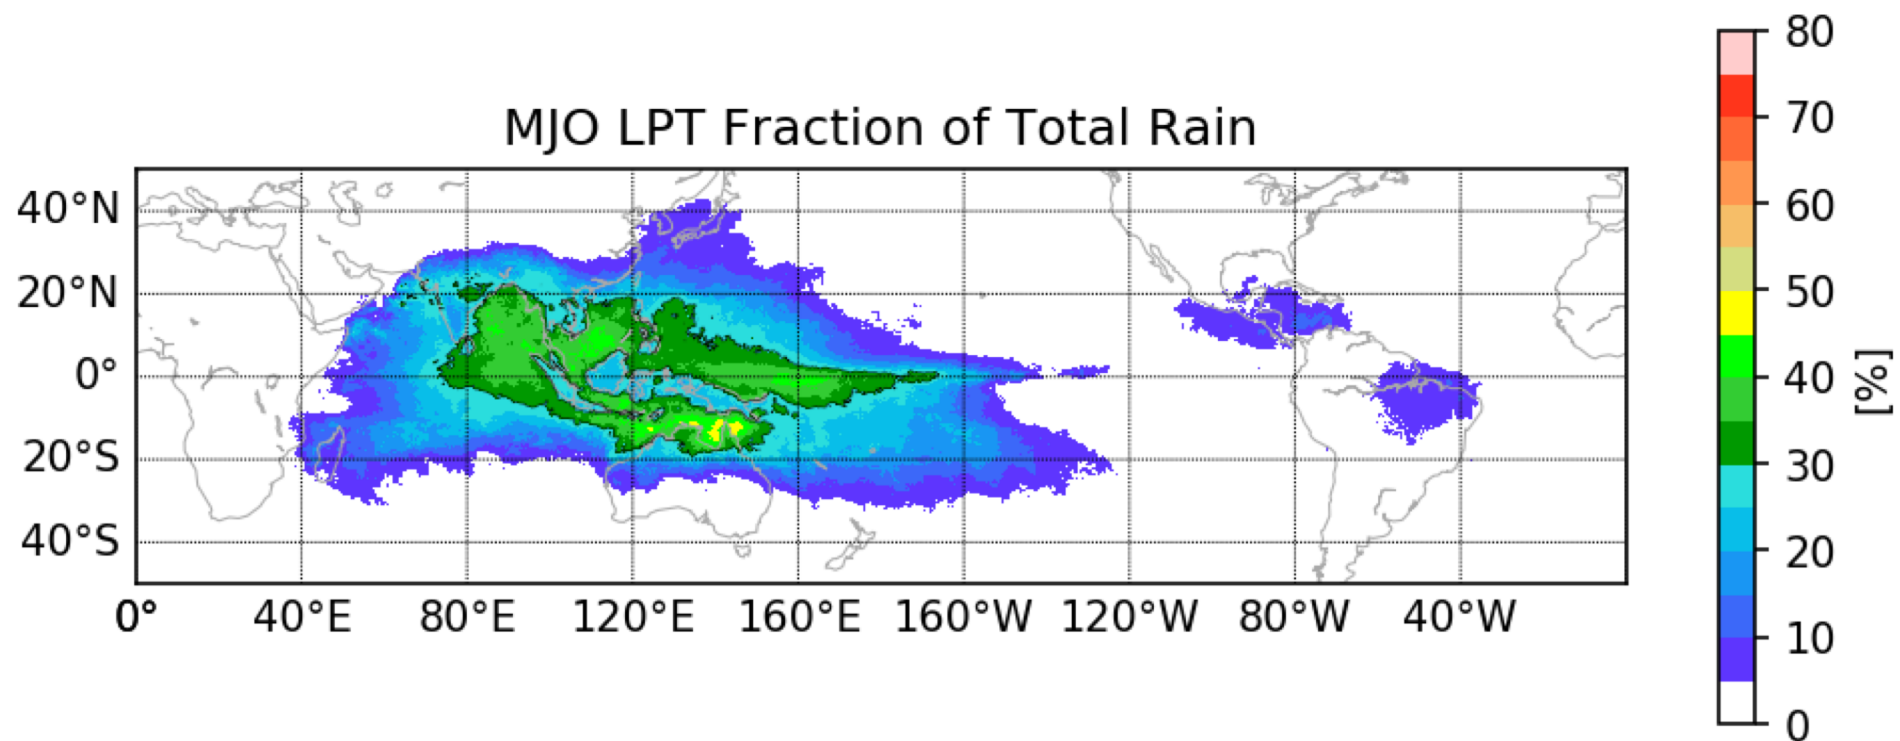

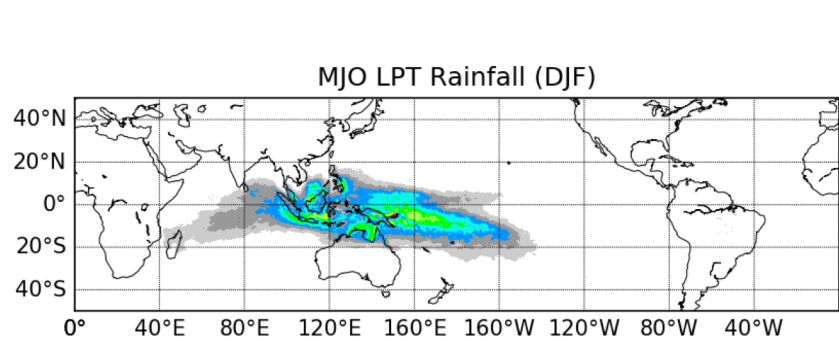

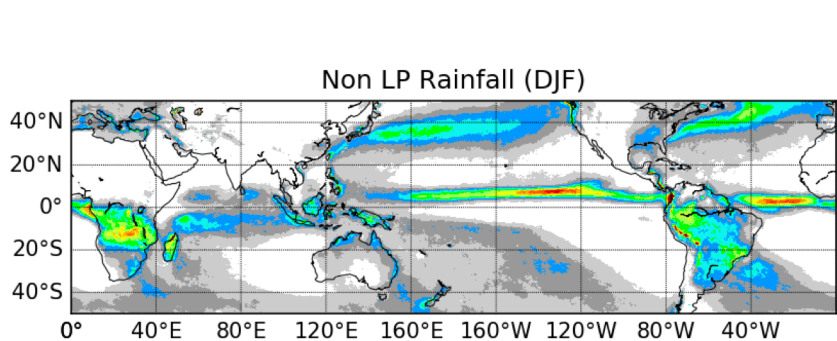

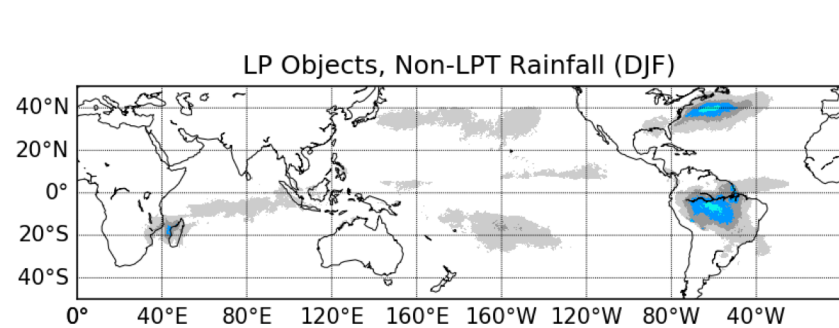

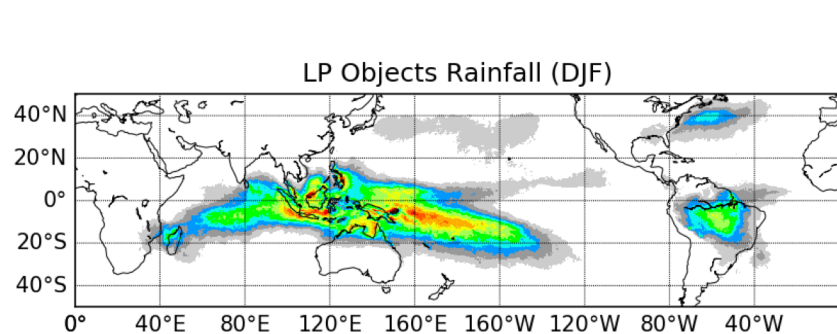

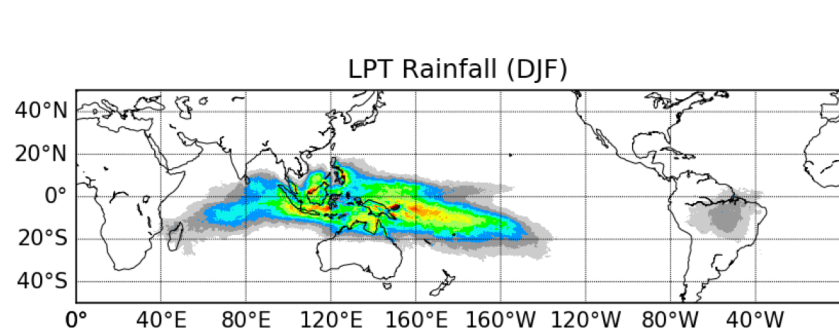

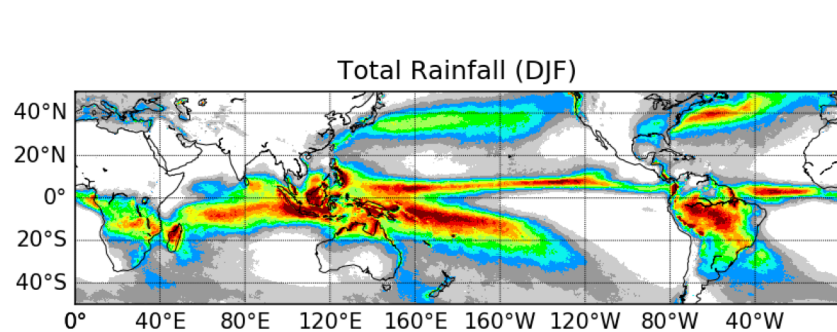

MJO LPT System Tracks: 1998 - 2018

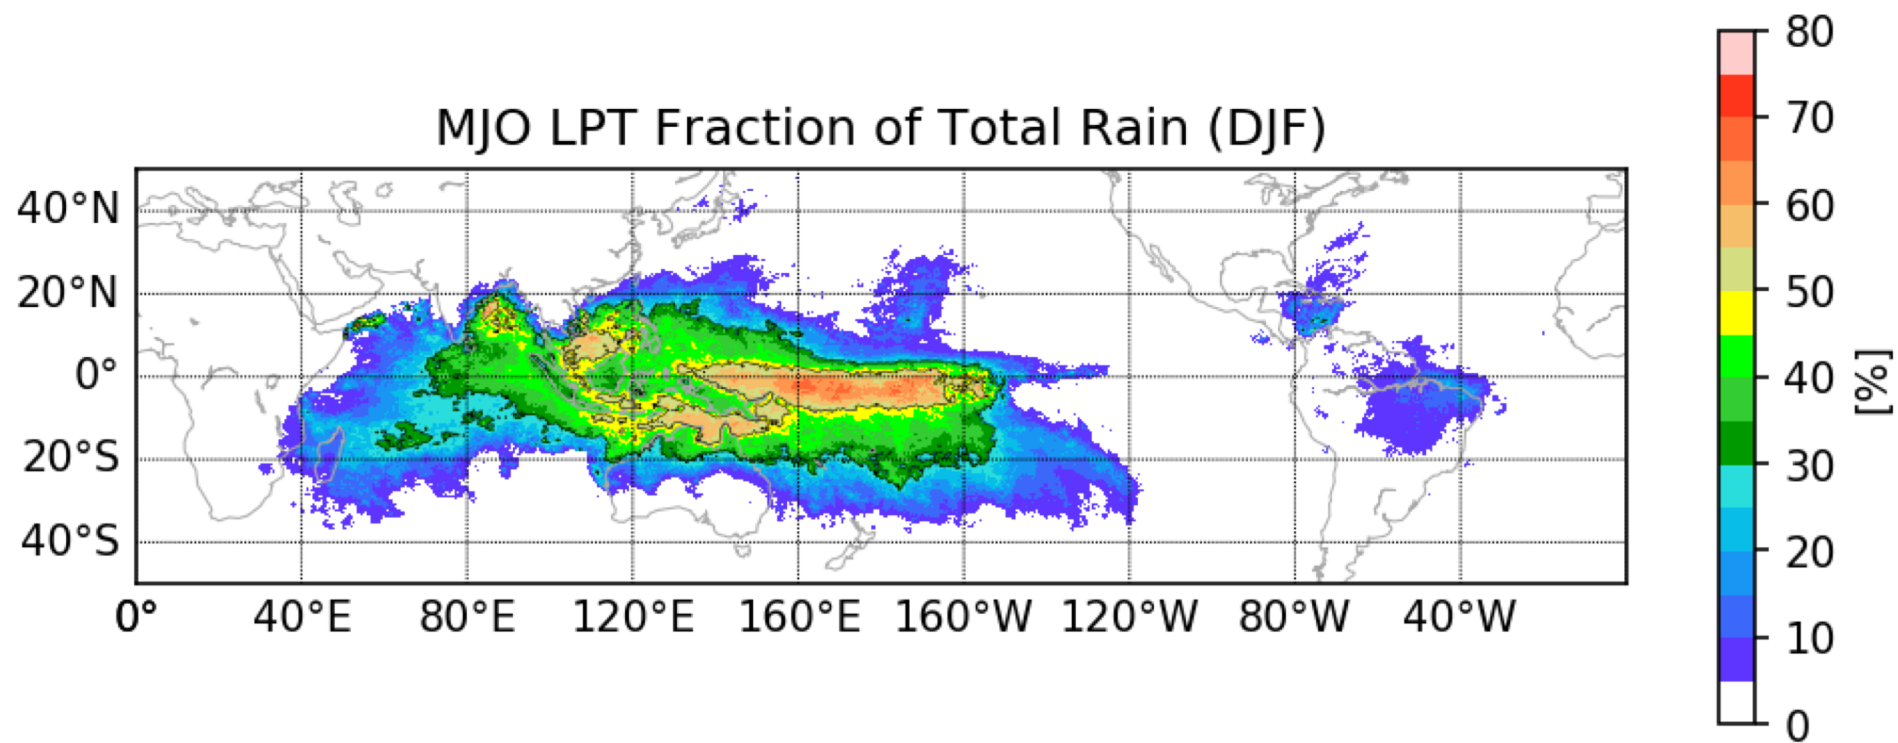

MJO LPT Fraction of Total Rain

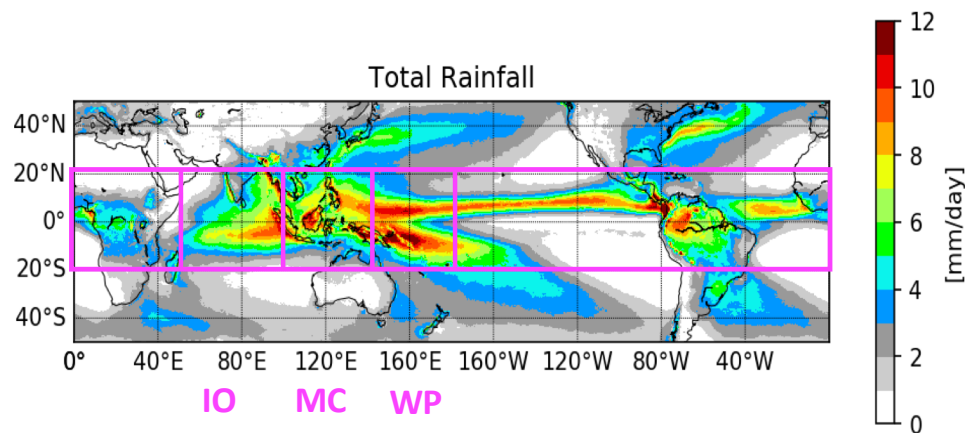

MJO LPT Fraction of Total Rain (DJF)

Contribution of Large-scale Precipitation to Total Rainfall

Global mean = 2.82 mm/day

LPT = 0.55 mm/day (20%)

MJO LPT = 0.28 mm/day (10%)

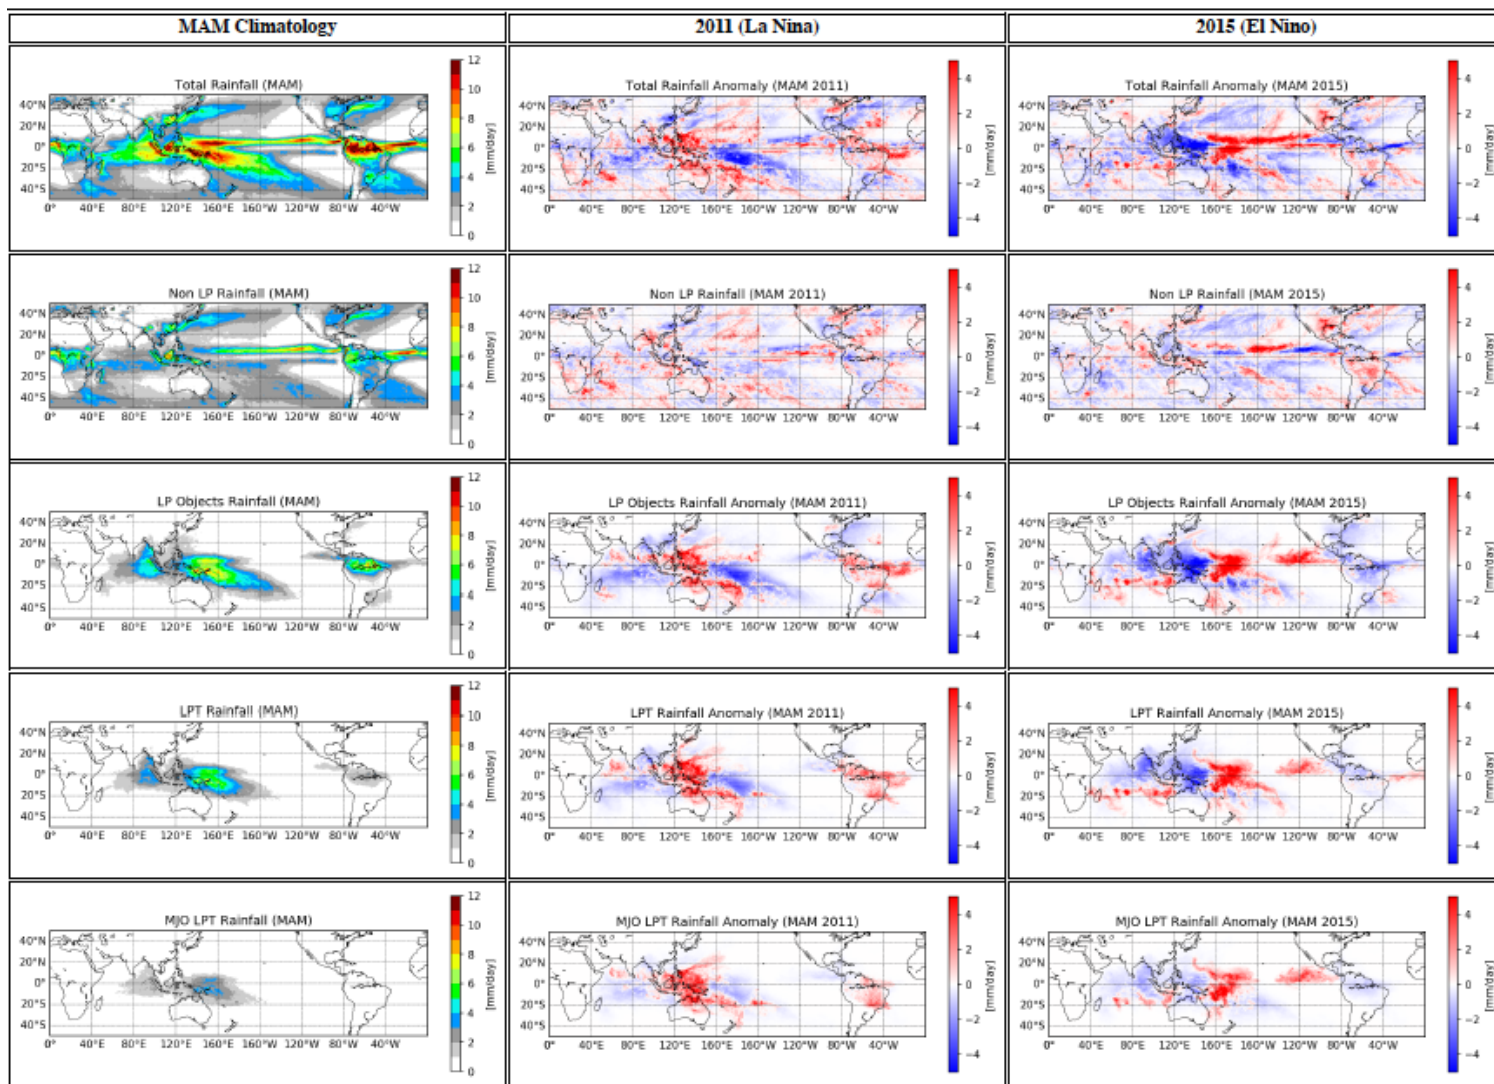

Tropical mean = 3.81 mm/day

LPT = 1.18 mm/day (31%)

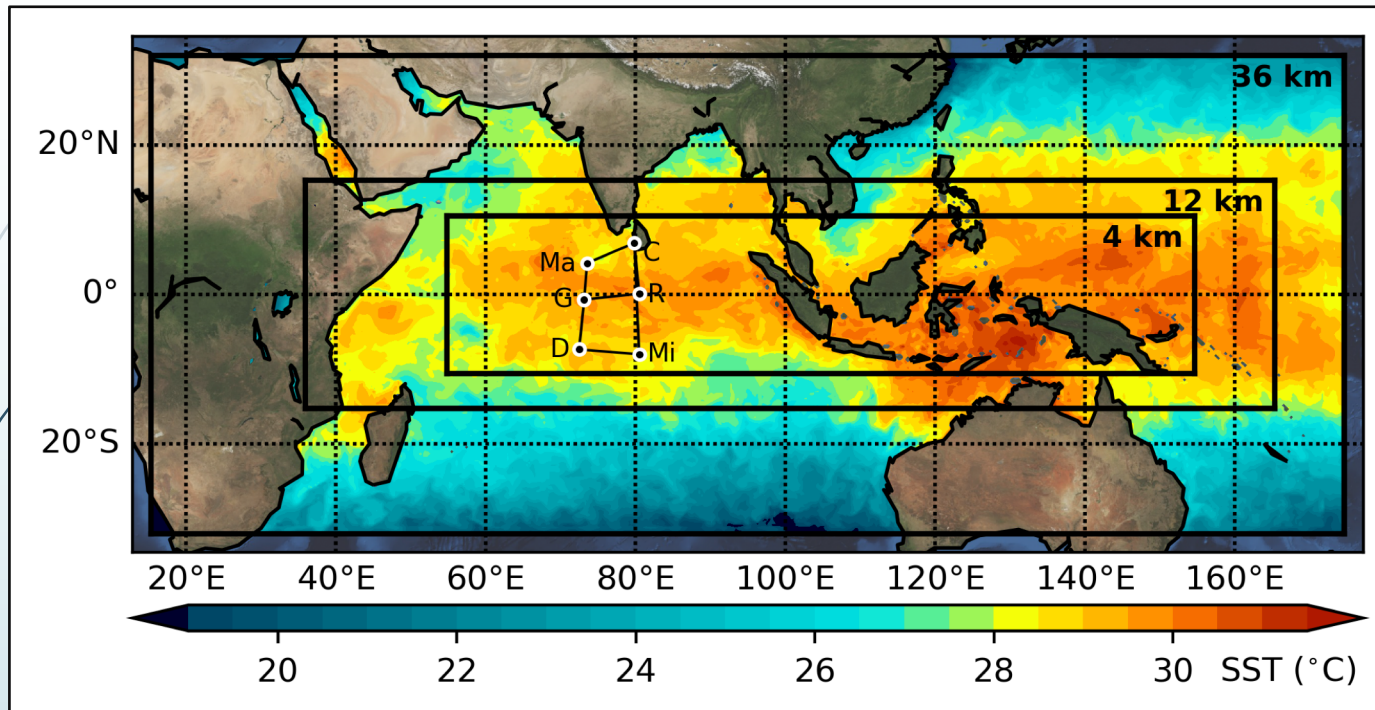

MJO LPT = 0.62 mm/day (16%)

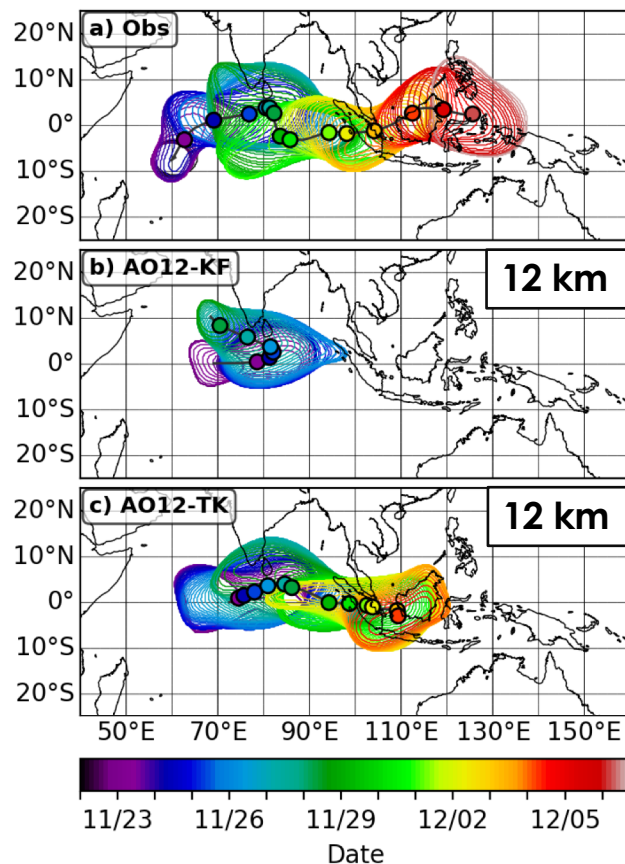

Coupled Atmosphere-Ocean Modeling

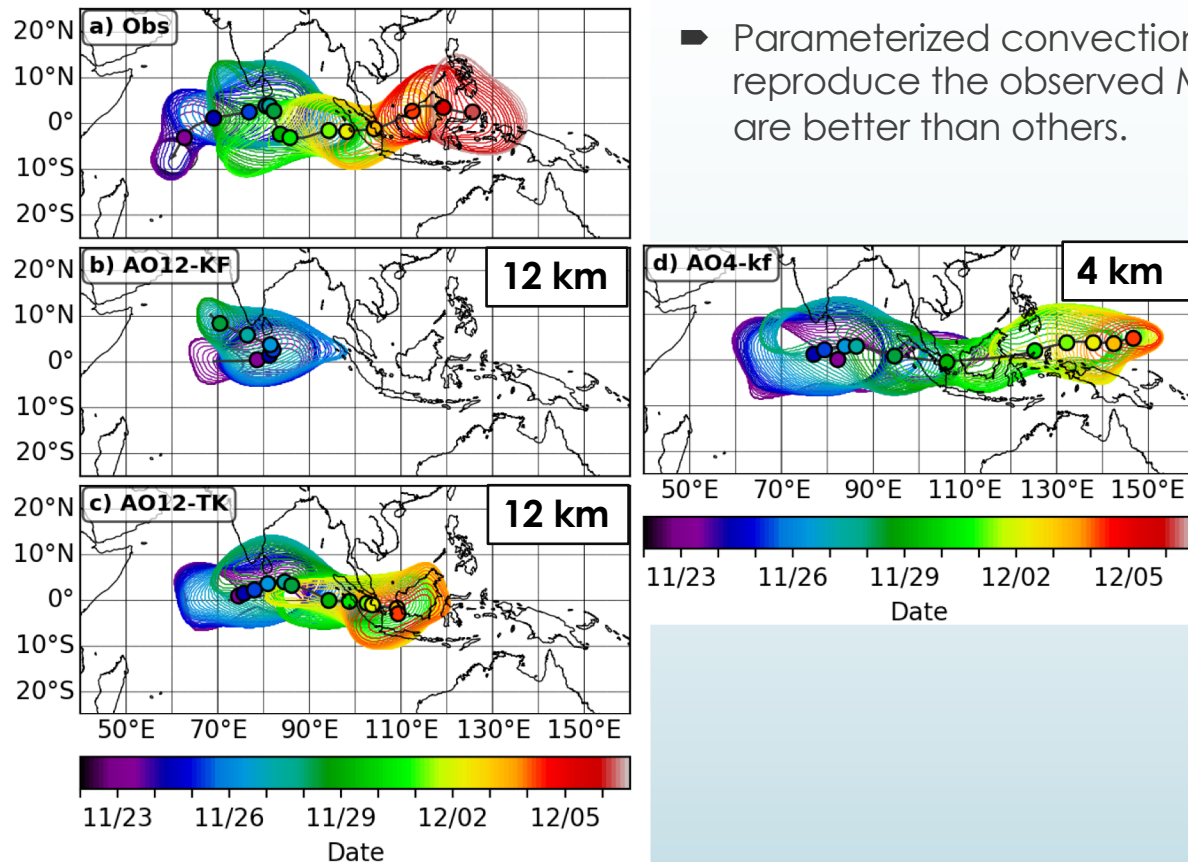

- 1) Sensitivity to model resolution (parameterized v. explicitly resolved convection).
- 2) Effect of air-sea coupling on MJO prediction.

Sensitivity to Model Resolution (Savarin and Chen 2018a)

- Parameterized convection (at 12 km) does not reproduce the observed MJO, but some schemes are better than others.

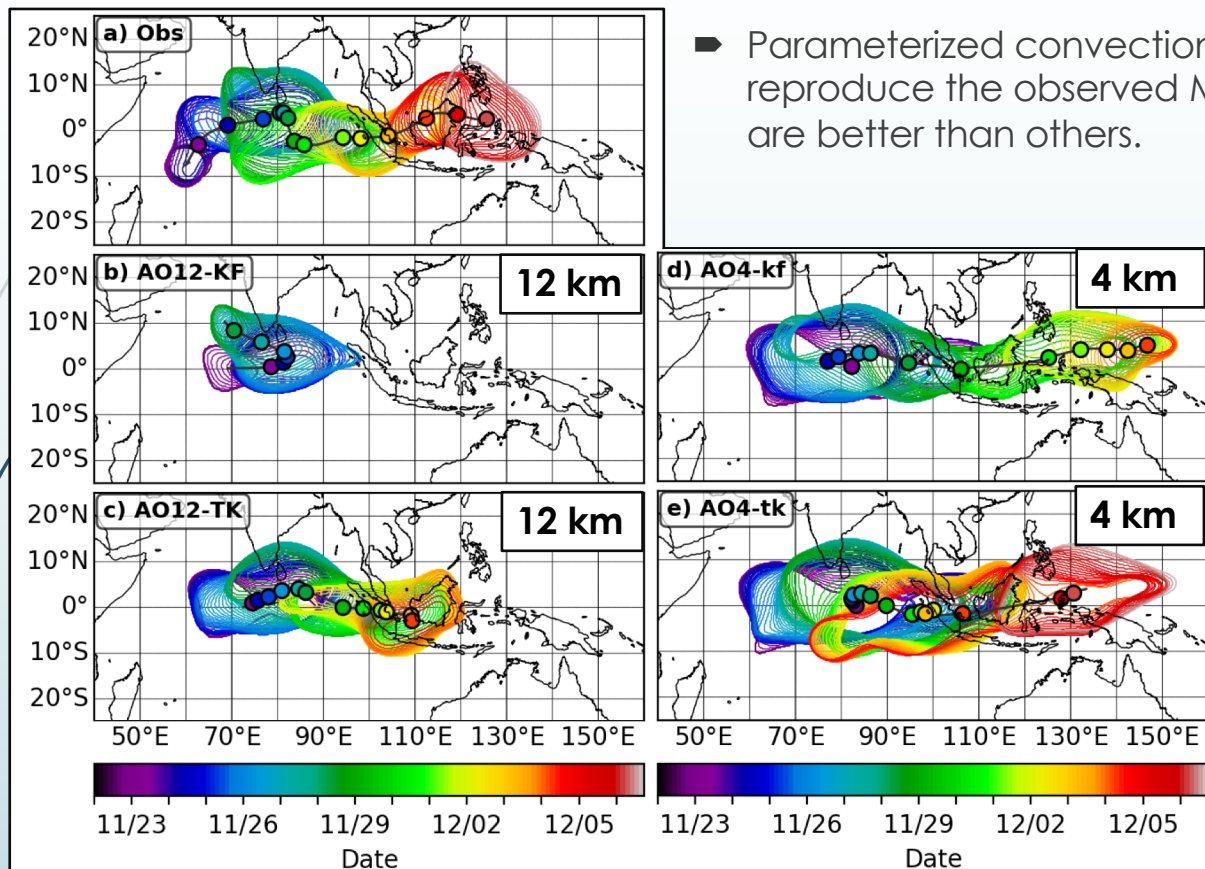

Sensitivity to Model Resolution (Savarin and Chen 2018a)

► Parameterized convection (at 12 km) does not reproduce the observed MJO, but some schemes are better than others.

► Explicitly resolved convection drastically improves the MJO prediction.

Sensitivity to Model Resolution (Savarin and Chen 2018a)

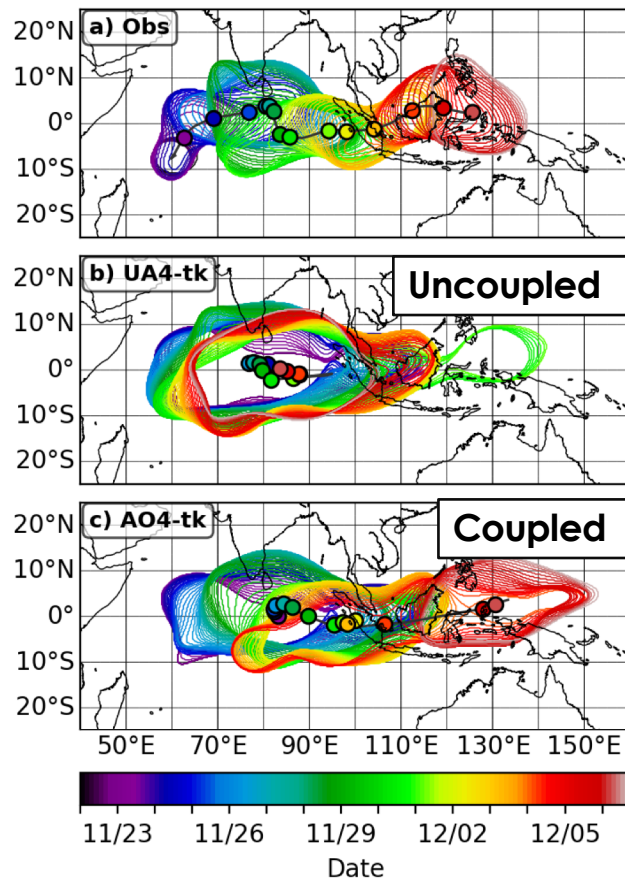

► Parameterized convection (at 12 km) does not reproduce the observed MJO, but some schemes are better than others.

- Explicitly resolved convection drastically improves the MJO prediction.
- Results vary depending on the lateral boundary conditions.

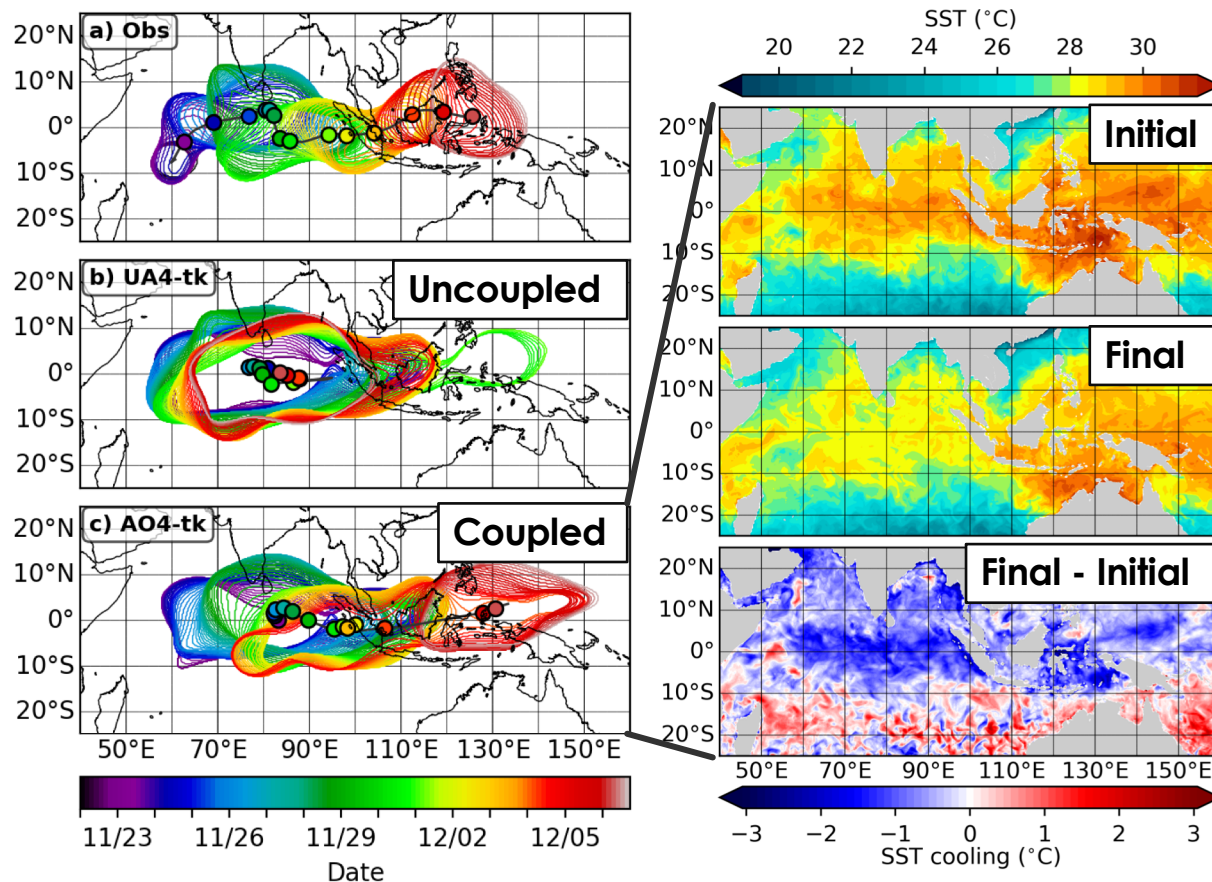

Impact of atmosphere-ocean coupling

(Savarin and Chen 2018b)

- Uncoupled model produces stationary “MJO”. Coupled model produces clear eastward propagation, as observed.

Impact of atmosphere-ocean coupling

- Uncoupled model produces stationary “MJO”. Coupled model produces clear eastward propagation, as observed.
- Reason for this difference is the SST cooling induced by the MJO.

SUMMARY

- **Large-scale Precipitation Tracking (LPT) provides a robust and direct measure of MJO convection, which can capture the spatial structure and its variability**
- **TRMM-GPM (TMPA) data provides an unique MJO climatology database for weather and climate research**
- **MJO impacts global weather downstream, which is key for subseasonal-to-seasonal (S2S) prediction, and a source of predictability.**
- **LPT can be used for verification of MJO prediction in both global and regional models**
- **Higher resolution and atmosphere-ocean coupling improve MJO initiation and its eastward propagation.**
